Checkpoint 3 Tulin 21-03-2024

Kremer, Yordi Y.C.T.J. a day ago

Today we had a lesson about Ethical requirements from our semester coach. I did not know anything about ethical requirements except for that privacy was probably one of them, so this lecture was really helpfull. She explained 6 main ethical requirements Data, Privacy, Bad actors, Transparancy, Sustainability and Inclusivity. we then played a game with these requirements to figure out what requirements are we going to be using for our group project. I also had a meeting with Tülin where we talked about my portfolio, I learned that I should make a seperate folder for my reading guide instead of putting the reading guide in my individual project folder and in my group project folder. I also planned a meeting with Tülin for next thursday to discuss my Portfolio before the deadline and get some more feedback.

Write a summary of what you discussed with your teacher...

Checkpoint 2 Wk04 - Individual Super project managers 13-03-2024

Kremer, Yordi Y.C.T.J. 8 days ago

I had a meeting with Jeffrey about my Research Plan I talked with him about my main question and sub questions. I reformed my sub questions after Jeffreys feedback. My main question is "How can I create a platform where people can watch YouTube videos in sync across multiple devices?" as I want to focus in the syncing in this project as this seems by far the hardest feature and the most interesting to me. The subquestions I use to answer this question are "What architecture is best suited for my project requirements?" for this question I will be using the research methods Explore user requirements -> Literature study -> Community Research -> IT architecture sketching. "what programming languages and frameworks are available for a good quality streaming service platform? " the research methods I will use for this question are Literature study -> Community Research and "What level of latency performance is considered acceptable for a streaming service to ensure a satisfactory user experience?" Is my third question for this one I will be using Literature study -> Best good and bad practices -> Non-functional test -> Observation. I changed my questions to better suit the main question by focusing more on the syncing. My planning for the upcoming sprint is finishing my research for these research questions and creating a start for my portfolio. I will also start on Technical requirements. At the end of this sprint I want to know exactly what I want to make and how.

Checkpoint 1 Wk02 - First timer 28-02-2024

Kremer, Yordi Y.C.T.J. 20 days ago

This week I had gave my Individual project pitch to Jeffrey about my Watch2gether clone idea he gave me the confirmation that this was a good project for me to work on this semester and stated that live video syncing is an interesting challenge. For our group project we Talked with Jeffrey about our user stories and we had a further explanation of the context of the project which made our goal way more clear. This week we divided research questions between our group members, I took the research question "How can I visualize logs and metrics in a meaningful manner in this project's context?". The research methods I chose to tackle this question are Available product analysis followed by Prototyping and Usability testing. I will look into existing products to see if there is good tools to use instead of making it ourselves and depending on this outcome I will make Designs and ideas to visualize this and test this with people to see how they navigate trough my designs.
